Rating System — Work Split

Oct 31, 2026 · @ahmad

The system is split into three parts. For every part, this doc lists what the owner has to **decide**, what they have to **hand to the other parts**, and what they **need from them**. The decisions are checklists to tick off as the team settles them.

Part	Owner	What it owns	Brief requirement it answers
1. Voting Gate		Everything a student sees and does, including login with the 42 alias	Fair 3-star rating and flagging
2. Data Engine		Vote weights, integrity of voters, abuse detection, student scores	Anti-abuse and spam protection
3. Staff Dashboard		Everything staff see and decide: review, profiles, analytics	Privacy and visibility controls

Part 1 — Voting Gate

What students see and do: how they get in, how they vote, and what they see of their own rating.

Decides

- [ ] Login: how a student signs in with their 42 Amman alias (code or link to their email)
- [ ] Entry point: how students reach the site (weekly reminder, link, widget)
- [ ] Home screen: what a student sees first after logging in
- [ ] Voting categories: the contexts a student picks from (after evaluation, general, behavioral, …)
- [ ] What each star level asks for: what 3, 2 and 1 star require (labels, comment, flag reason, explanation length)
- [ ] Flag reasons list and positive labels list
- [ ] Voting frequency: weekly limit, time between votes, voting window, how often the same person can be rated

- [ ] Who can be rated: searching for a student, no rating yourself
- [ ] What a student sees of their own rating, and when it appears
- [ ] Whether a student can change or withdraw a vote
- [ ] The full student flow, start to finish

Hands to the others

- **To the Data Engine:** the categories, star rules, flag reasons, labels and voting limits, plus the vote fields the gate produces (see Shared vote record)
- **To the Staff Dashboard:** the categories, flag reasons and labels, so staff can filter by them

Needs from the others

- **From the Data Engine:** each student's aggregate score and whether it is ready to show; which voting limits the engine enforces and what the student is told when a vote is blocked

Part 2 — Data Engine

The logic behind the votes: how much each vote counts, how trustworthy each voter is, which cases look risky, and what score each student ends up with.

Decides

- [ ] Vote weight: what makes one vote count more or less (voter integrity, category, how the voter usually rates)
- [ ] Voter integrity: what raises it and what lowers it (staff confirming or rejecting their flags, voting patterns)
- [ ] Abuse patterns to detect: sudden piles of low votes on one student, the same group voting the same way, pairs voting for each other, voting too often
- [ ] Risk levels: what makes a vote risky, and which levels get held for staff
- [ ] When a vote counts: right away, or only after staff review
- [ ] Student score: how the aggregate is calculated, the minimum number of votes before it is shown, and how older votes age
- [ ] What changes after a staff decision: the vote's status, the voter's integrity, the student's score

- [ ] The metrics staff will see, with a one-line definition of each

Hands to the others

- **To the Voting Gate:** each student's score and whether it is ready to show; the rules for when a vote is blocked
- **To the Staff Dashboard:** risk levels and the reason each case was flagged, integrity scores, and the metrics with their definitions

Needs from the others

- **From the Voting Gate:** categories, star rules, flag reasons, labels and voting limits
- **From the Staff Dashboard:** the decisions staff can make and what each one means

Part 3 — Staff Dashboard

What staff see and decide: reviewing risky votes, looking into students, and seeing how the system is doing overall.

Decides

- [ ] Staff login and access: how staff sign in, and whether all staff have the same access
- [ ] Home screen: what a staff member sees first
- [ ] Review queue: how items are ordered, and what each item shows (the vote, explanation, category, why it was flagged, the voter's history, related votes)
- [ ] Staff decisions: the actions available on a vote (confirm, reject, …) and what each one means
- [ ] Student profile: what staff see about one student (score and trend, votes received and given, flags, integrity, voting frequency)
- [ ] Campus analytics: the overall views (score distribution, flag reasons used, review backlog)
- [ ] Settings staff can change: flag reasons, labels, voting limits, risk thresholds
- [ ] The full staff flow, start to finish

Hands to the others

- **To the Data Engine:** the decisions staff make and what each one means

- **To the Voting Gate:** any setting staff change that students see (flag reasons, labels, limits)

Needs from the others

- **From the Data Engine:** risk levels and flag reasons per case, integrity scores, metrics with definitions
- **From the Voting Gate:** categories, flag reasons and labels

Shared vote record

All three parts work on the same vote. Each field has one part that sets it; the others only read it. Agree on this list first, so everyone builds on the same thing.

Field	Set by	Read by
Voter	Voting Gate	Engine, Dashboard
Voted student	Voting Gate	Engine, Dashboard
Category	Voting Gate	Engine, Dashboard
Stars (1–3)	Voting Gate	Engine, Dashboard
Labels	Voting Gate	Engine, Dashboard
Flag reason	Voting Gate	Engine, Dashboard
Explanation	Voting Gate	Dashboard
Time	Voting Gate	Engine, Dashboard
Weight	Data Engine	Dashboard
Risk level and reasons	Data Engine	Dashboard
Status (counted, held, rejected)	Data Engine	Gate, Dashboard
Staff decision	Staff Dashboard	Engine
Reviewed by and when	Staff Dashboard	Dashboard

What we need to turn in at the end of phase 1:

1. A system proposal document
2. A slide deck that explains our solution idea
